

Temperature:

The amount of randomness taken by the LLM to generate response back to user

Thinking Effort:

the amount of deepness in thinking/reasoning taken by the AI model to generate response back to user.

Types of thinking efforts:

low thinking --> less deepness in thinking/reasoning, hence time consumed to generate the response is low i.e quick or less delay.

medium thinking --> medium deepness in thinking/reasoning, hence time consumed to generate the response is medium i.e medium delay.

high thinking --> high deepness in thinking/reasoning, hence time consumed to generate the response is high i.e high delay.
